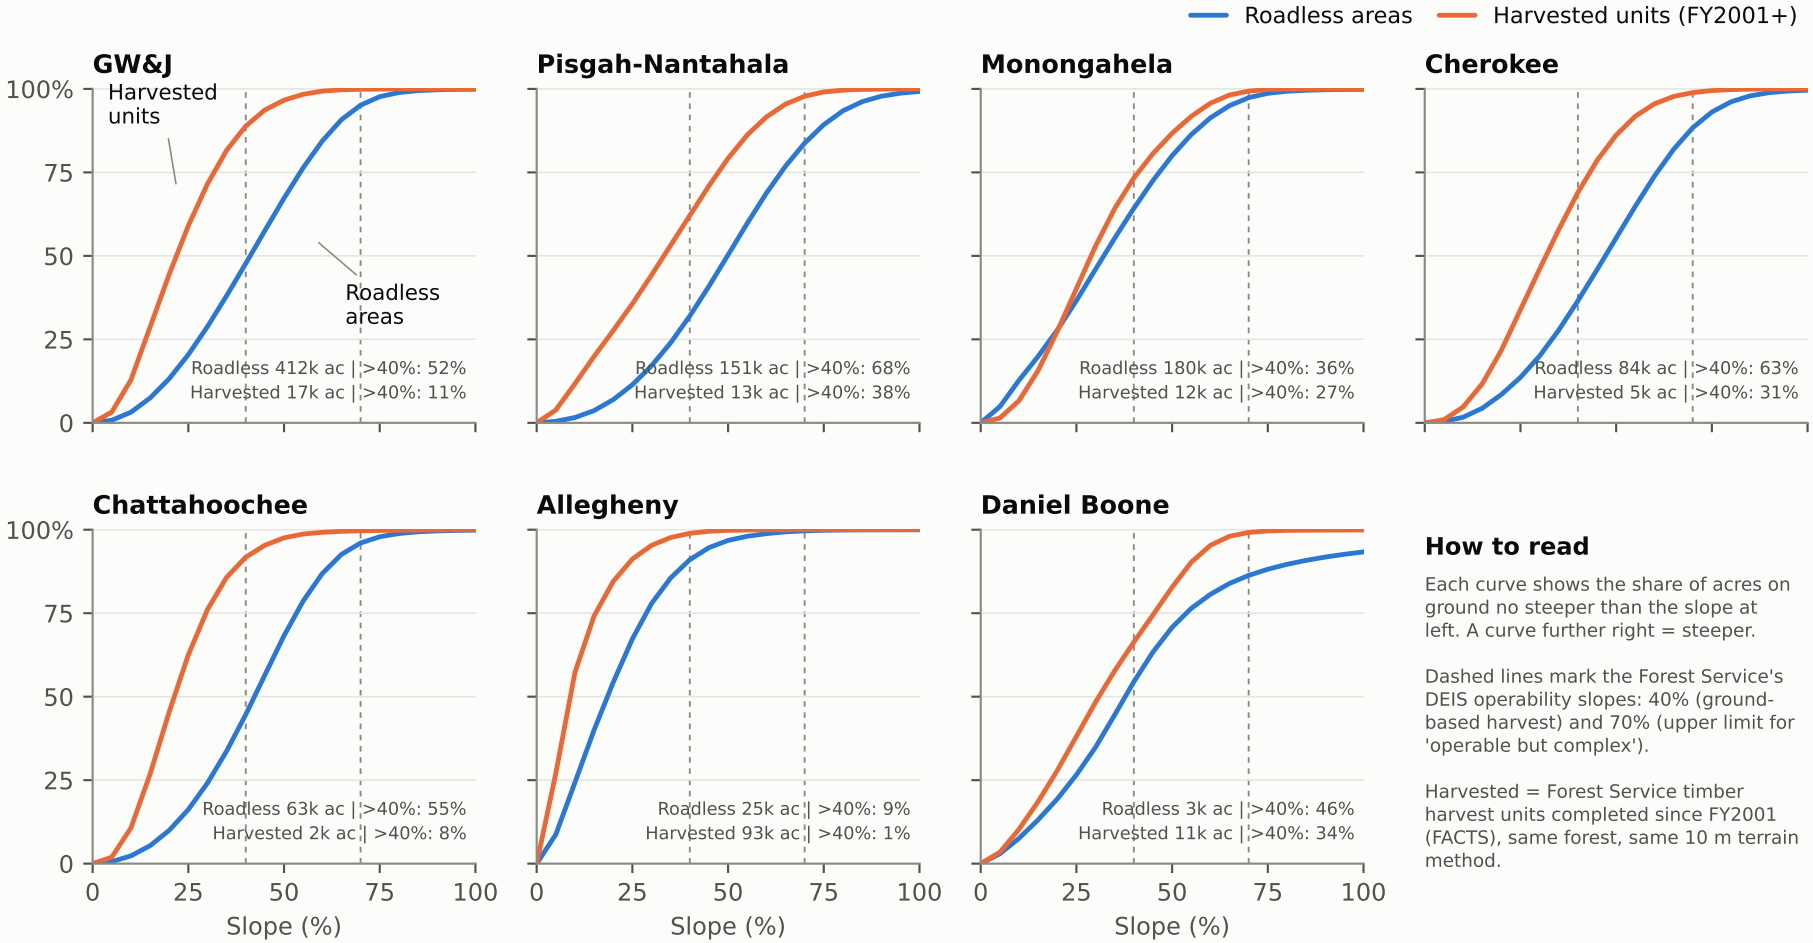
Roadless land is generally steeper than harvested land, but the distributions overlap substantially



How to read

Each curve shows the share of acres on ground no steeper than the slope at left. A curve further right = steeper.

Dashed lines mark the Forest Service's DEIS operability slopes: 40% (ground-based harvest) and 70% (upper limit for 'operable but complex').

Harvested = Forest Service timber harvest units completed since FY2001 (FACTS), same forest, same 10 m terrain method.

Sources: USFS EDW (2001 IRA inventory; FACTS timber harvest polygons); USGS 3DEP 1/3 arc-second DEM, Horn slope. Daniel Boone has only about 2,800 roadless acres.
