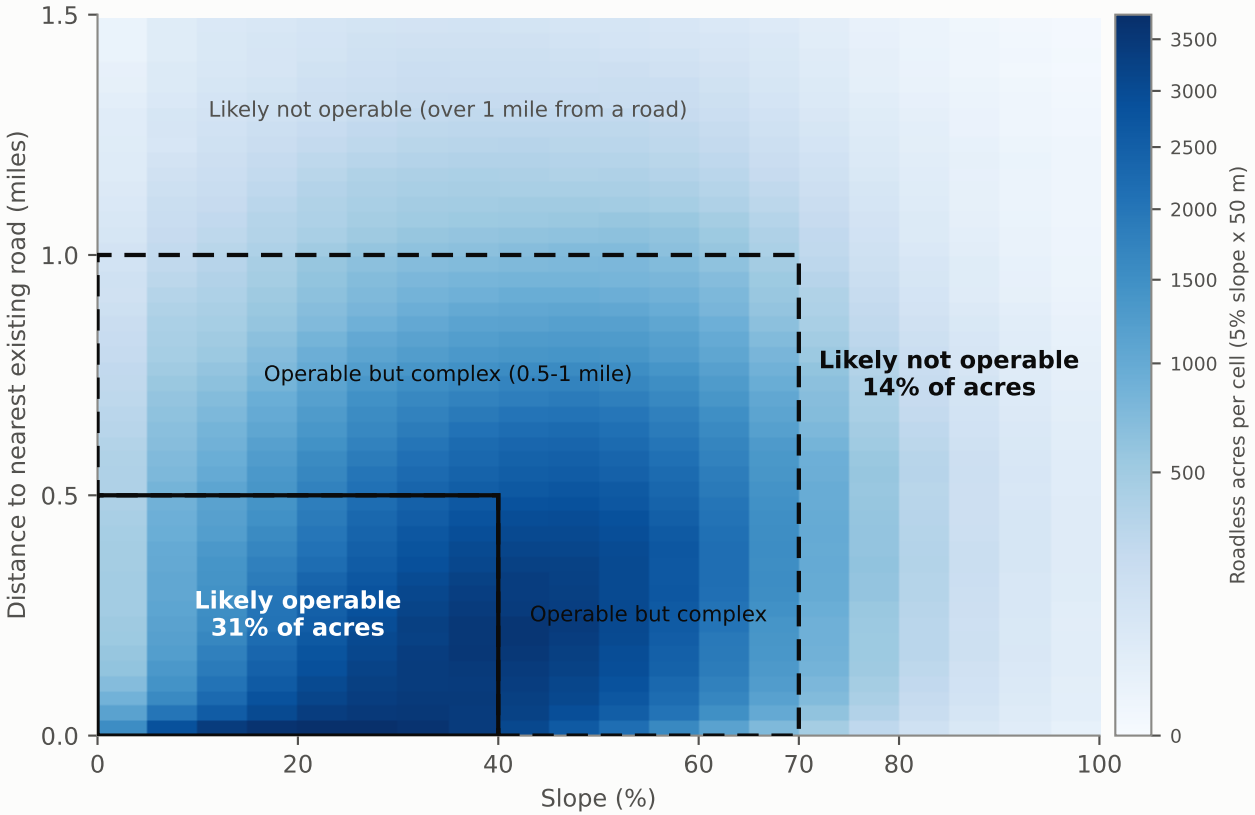
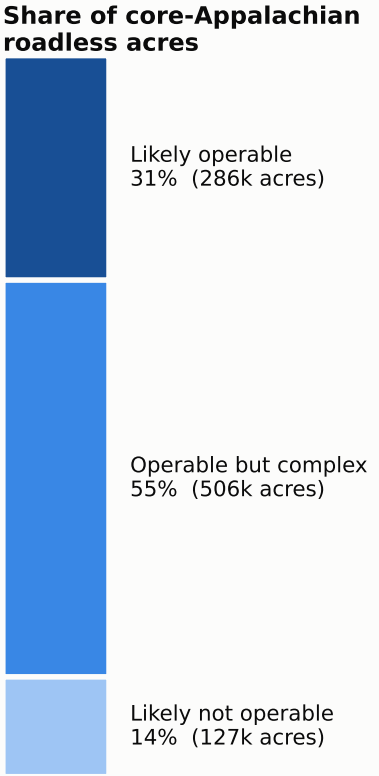
By the Forest Service's own screen, terrain and road access do not rule out most Appalachian roadless land

Draft EIS criteria: operable = under 0.5 mi from a road and under 40% slope; complex = up to 70% slope within 1 mi





Slope and road-distance criteria only. Excludes site productivity and forest-plan restrictions, so 'operable' is an upper bound.

Sources: USFS 2001 IRA inventory; USGS 3DEP 10 m DEM (Horn slope); USGS TNM/TIGER roads and USFS system roads. Distance beyond 1.5 mi not shown (counted as not operable). The DEIS does not state its DEM resolution; 30 m terrain data would classify more land as operable.
