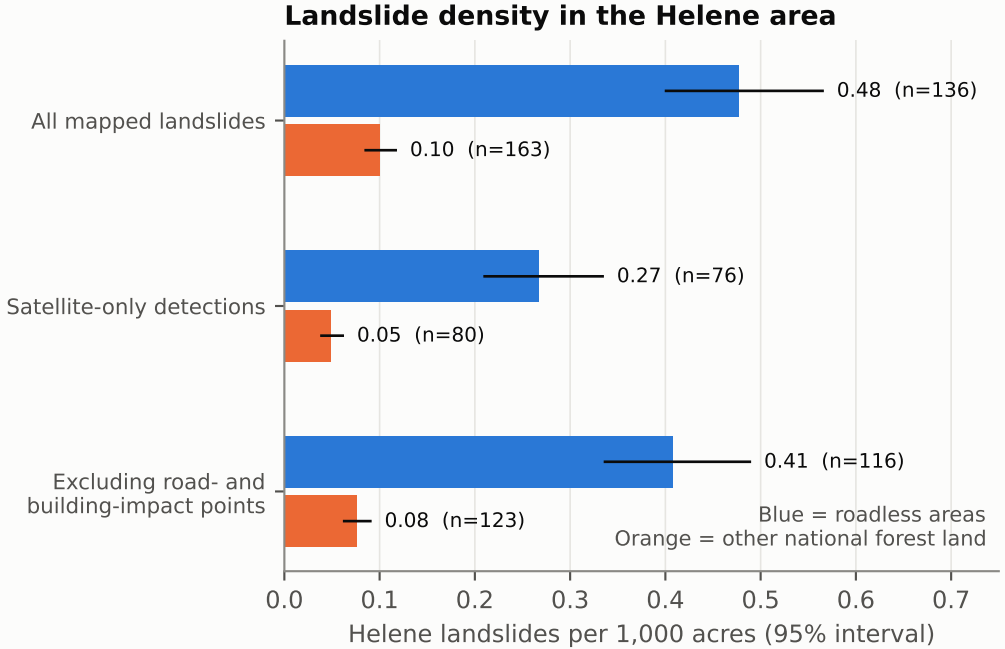
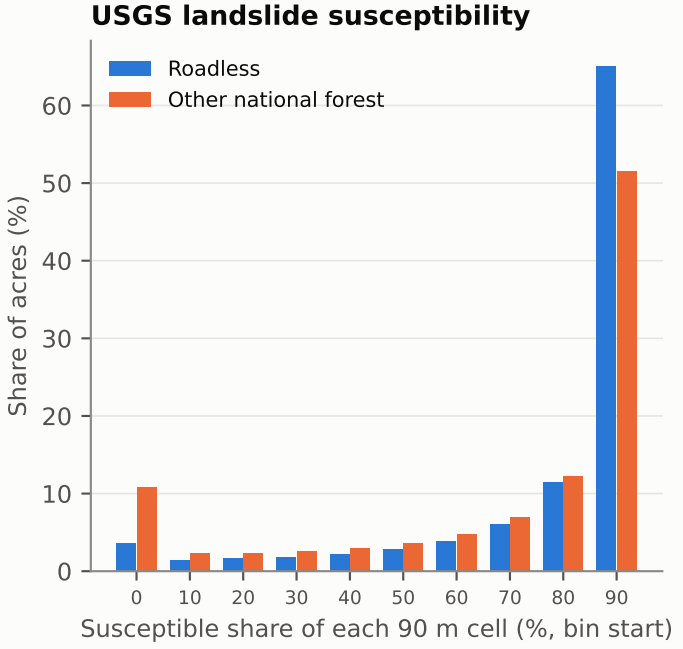
Roadless areas sit on failure-prone ground; Helene landslides were mapped there at about five times the density





Sources: USGS preliminary Helene landslide inventory (Burgi et al. 2024, point data, reviewed version); USGS slope-relief landslide susceptibility (Mirus et al. 2024, n10 model); USFS ownership and IRA layers. Descriptive only: rainfall, slope, mapping effort and canopy differ between areas. Inventory is preliminary and incomplete. Not evidence that logging or roads caused any landslide.
